REC'D 17 NOV 2003

WIPO PCT

## PRIORITY DOCUMENT

SUBMITTED OR TRANSMITTED IN  
COMPLIANCE WITH RULE 17.1(a) OR  
(b)

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Signed

Dated 28 October 2003

## Request for grant of a patent

(See the notes on the back of this form. You can also get an explanatory leaflet from the Patent Office to help you fill in this form)

The Patent Office

Cardiff Road  
Newport  
South Wales  
NP10 8QQ

1. Your reference	N.86206 PEJ		
2. Patent application number (The Patent Office will fill in this part)	0223724.6		11 OCT 2002
3. Full name, address and postcode of the or of each applicant (underline all surnames)	Rhodia Organique Fine Limited PO Box 46, St Andrew's Road Avonmouth, Bristol BS11 9YF United Kingdom		
Patents ADP number (if you know it)	848 2499001		
If the applicant is a corporate body, give the country/state of its incorporation			
4. Title of the invention	REFRIGERANT COMPOSITIONS		
5. Name of your agent (if you have one)	J.A. KEMP & CO.		
"Address for service" in the United Kingdom to which all correspondence should be sent (including the postcode)	14 South Square Gray's Inn London WC1R 5JJ		
Patents ADP number (if you know it)	26001		
6. If you are declaring priority from one or more earlier patent applications, give the country and the date of filing of the or of each of these earlier applications and (if you know it) the or each application number	Country	Priority application number (if you know it)	Date of filing (day / month / year)
7. If this application is divided or otherwise derived from an earlier UK application, give the number and the filing date of the earlier application	Number of earlier application	Date of filing (day / month / year)	
8. Is a statement of inventorship and of right to grant of a patent required in support of this request? (Answer 'Yes' if: a) any applicant named in part 3 is not an inventor, or b) there is an inventor who is not named as an applicant, or c) any named applicant is a corporate body. See note (d))	Yes

**Warning**

*After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.*

**Notes**

- a) *If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.*
- b) *Write your answers in capital letters using black ink or you may type them.*
- c) *If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.*
- d) *If you have answered 'Yes' Patents Form 7/77 will need to be filed.*
- e) *Once you have filled in the form you must remember to sign and date it.*
- f) *For details of the fee and ways to pay please contact the Patent Office.*

# REFRIGERANT COMPOSITIONS

The present invention relates to refrigerant compositions, particularly low temperature refrigerants for use in cold stores.

5 There is a need for a low temperature refrigerant for use in cold stores. Prior to the Montreal Protocol, this function was filled by R502, an azeotrope of R115 and R22. This refrigerant was particularly attractive in low temperature situations where R12 ( $\text{CCl}_2\text{F}_2$ ) or R22 were reaching their effective working limits. At these low temperatures it was possible to achieve a significant increase in capacity over that  
10 obtainable with R22 with a major benefit being operation at considerably lower discharge temperatures. However, since R502 contains R115, which is a strong ozone depleter, it is now no longer available for use.

Subsequently, this requirement has been partially met by using two blends containing R143a. The first is R404A, which consists of R125(44%w/w),  
15 R143a(52%w/w) and R134a(4%w/w). The second is R507A, which consists of an azeotropic mixture of R125 (50%w/w) and R143a (50%w/w).

The problem with these blends is that they have very high global warming potentials (GWP).

The concept of a Global Warming Potential (GWP) has been developed to  
20 compare the ability of a greenhouse gas to trap heat in the atmosphere relative to another gas. Carbon dioxide ( $\text{CO}_2$ ) has been chosen as the reference gas. Since GWP's are ratios, they are dimensionless. The GWP's quoted below are those given in IPCC -1995 for 100 year time horizons. The GWP's for blends are calculated by summing the products of the mass fraction times the individual component's GWP.

25 A greenhouse gas is a gas that causes the Earth's atmosphere to trap heat. The greenhouse gas allows the sun's radiation to reach the Earth's surface. The Earth's surface is heated by this radiation and emits longer wavelength infra-red radiation due to the heating. The greenhouse gas now prevents this radiation from escaping back into space by absorbing it and hence traps it in the atmosphere.

30 R507 has a GWP of 3300 and R404A is only slightly less at 3260. These high GWP's are due to the presence of R143a. Pure R143a has a GWP of 3800 compared to that of the other main component, R125, which is only 2800.

R22 alone has also been used, but this is an ozone depleter that will be phased out over the next decade. Also, the efficiency of R22 at the low temperatures required for cold storage is poor.

There is now considerable concern about global warming and, hence, it is important to use blends with as low a GWP as possible. Clearly there is a need to find a substitute for R502, which is not an ozone depleter, has a low GWP and can operate more efficiently at the low temperatures required than R22, R404A or R507.

According to the present invention there is provided a refrigerant composition which comprises:

(a) pentafluorethane, trifluoromethoxydifluoromethane or hexafluorocyclopropane, or a mixture of two or more thereof, in an amount of at least 75% based on the weight of the composition,

(b) 1,1,1,2- or 1,1,2,2-tetrafluoroethane, trifluoromethoxypentafluoroethane, 1,1,1,2,3,3-heptafluoropropane or a mixture of two or more thereof, in an amount of from 5 to 24% by weight based on the weight of the composition and

(c) an ethylenically unsaturated or saturated hydrocarbon, optionally containing one or more oxygen atoms, with a boiling point from  $-50^{\circ}\text{C}$  to  $+35^{\circ}\text{C}$ , or a mixture thereof, in an amount from 1% to 4% by weight based on the weight of the composition, the weight ratio of component (a): component (b) being at least 3:1.

The percentages quoted above refer, in particular, to the liquid phase. The corresponding ranges for the vapour phase are as follows:

(a) at least 85%, (b) 2 to 12% and (c) 0.8 to 3%, all by weight based on the weight of the composition. These percentages preferably apply both in the liquid and vapor phases.

The present invention also provides a process for producing refrigeration which comprises condensing a composition of the present invention and thereafter evaporating the composition in the vicinity of a body to be cooled. The invention also provides a refrigeration apparatus containing, as refrigerant, a composition of the present invention.

Component (a) is present in an amount of at least 75% by weight based on the

weight of the composition. In practice, the concentration will generally be at least 80% by weight with a preferred range of 80 to 90 to % by weight, especially 83 to 88% by weight, in particular about 85% by weight. Preferably, component (a) is R125 (pentafluorethane) or a mixture containing at least an half, especially at least three quarters (by mass) of R125. Most preferably component (a) is R125 (alone).  
5 Generally the cooling capacity of the composition increase with increasing R125 content; the best cooling capacity and efficiency can be obtained with about 85% R125.

Component (b) is present in the composition in an amount from 5 to 24% by weight based on the weight of the composition. Typically, the component is present in an amount from 7.5% to 20%, generally 10% to 15%, by weight, especially about 11.5% by weight. Component (b) is preferably a mixture containing at least an half, especially at least three quarters (by mass) of R134a (1,1,1,2-tetrafluoroethane).  
10 Most preferably component (b) is R134a (alone).

The weight ratio of component (a): component (b) is at least 3:1, generally at least 4:1, preferably 5:1 to 10:1 and especially 7:1 to 9:1.  
15

Component (c) is a saturated or ethylenically unsaturated hydrocarbon, optionally containing one or more oxygen atoms, in particular one oxygen atom, with a boiling point from -50°C to +35°C or a mixture thereof. Preferred hydrocarbons which can be used possess three to five carbon atoms. They can be acyclic or cyclic.  
20 Acyclic hydrocarbons which can be used include propane, n-butane, isobutane, pentane, isopentane and dimethyl and ethylmethyl ether as well as propane. Cyclic hydrocarbons which can be used include cyclo butane, cyclo propane, methyl cyclo propane and oxetan. Preferred hydrocarbons include n-butane and isobutane, with n-butane being especially preferred.  
25

The presence of at least one further component in the composition is not excluded. Thus although, typically, the composition will comprise the three essential components, a fourth component, at least, can also be present. Typical further components include other fluorocarbons and, in particular, hydrofluorocarbons, such as those having a boiling point at atmospheric pressure of at most -40°C, preferably  
30 at most -49°C, especially those where the F/H ratio in the molecule is at least 1,

preferably R23, trifluoromethane and, most preferably, R32, difluoromethane. In general, the maximum concentration of these other ingredients does not exceed 10% and especially not exceeding 5% and more especially not exceeding 2%, by weight, based on the sum of the weights of components (a), (b) and (c). The presence of hydrofluorocarbons generally has a neutral effect on the desired properties of the formulation. Desirably one or more butanes, especially n-butane or iso-butane, represents at least 70%, preferably at least 80% and more preferably at 90%, by weight of the total weight of hydrocarbons in the composition. It will be appreciated that it is preferable to avoid perhalocarbons so as to minimise any greenhouse effect and to avoid hydrohalogenocarbons with one or more halogen heavier than fluorine. The total amount of such halocarbons should advantageously not exceed 2%, especially 1% and more preferably 0.5%, by weight.

It has been found that the compositions of the present invention are highly compatible with the mineral oil lubricants which have been conventionally used with CFC refrigerants. Accordingly the compositions of the present invention can be used not only with fully synthetic lubricants such as polyol esters (POE), polyalkyleneglycols (PAG) and polyoxypropylene glycols or with fluorinated oil as disclosed in EP-A-399817 but also with mineral oil and alkyl benzene lubricants including naphthenic oils, paraffin oils and silicone oils and mixtures of such oils and lubricants with fully synthetic lubricants and fluorinated oil.

The usual additives can be used including "extreme pressure" and antiwear additives, oxidation and thermal stability improvers, corrosion inhibitors, viscosity index improvers, pour point depressants, detergents, anti-foaming agents and viscosity adjusters. Examples of suitable additives are included in Table D in US-A-4755316.

The following Examples further illustrate the present invention.

#### Examples

**Determination of vapour pressure/temperature relationship for the blends to be tested.**

The samples used for testing are detailed in Table 1.

### Equipment and experimental

5

The equipment used for determining the vapour pressure/temperature relationship consisted of a 1 litre Parr reactor immersed completely in a thermostatically controlled water bath. The bath temperature was measured using a calibrated platinum resistance thermometer with an Isotech TTI1 indicator. The resolution of the thermometer is  $0.01^{\circ}\text{C}$ . The pressure (press) was read with a calibrated pressure transducer with an experimental accuracy of 0.01 bara and read on a Druck DR1 instrument.

10

Approximately, 1.2kg of the refrigerant was charged into the Parr reactor. The reactor was then cooled overnight. When it had reached temperature, the pressure and temperatures were recorded every ten minutes until constant.

15

The data obtained does not give the dew point and hence does not give the glide. An approximate evaluation of the glide can be obtained by using the REFPROP 6 program. The relationship of the glide to the bubble point is usually nearly linear and can be represented by a linear equation. In the case of R407C, a binomial equation had to be used. These equations can now be used to give an approximate glide for the experimentally determined bubble points. This is effectively a normalisation of the calculated glide to the experimentally determined data. The pressure of the dew point can now be approximated by applying the relationship for temperature/pressure, which was found for the bubble point. The glide equations obtained are also shown in Table 2. These equations can now be used to obtain vapour pressure/temperature tables.

20

25

**Determination of the performance of the refrigerants on the low temperature (LT) calorimeter.**

30

**Equipment and general operating conditions**

The performance of the refrigerants was determined on the low temperature (LT) calorimeter. The LT calorimeter is fitted with a Bitzer semi-hermetic condensing unit containing Shell SD oil. The hot vapour passes out of the compressor, through an oil separator and into the condenser. The discharge pressure at the exit of the compressor is kept constant by the means of a packed gland shut-off valve. This inevitably has an effect on the condensing pressure/temperature – the system is actually condensing at a temperature below 40°C. The refrigerant then travels along the liquid line to the evaporator.

The evaporator is constructed from 15mm Cu tubing coiled around the edges of a well insulated 32cm<sup>3</sup> SS bath. The bath is filled with 50:50 glycol:water solution and heat is supplied to it by 3x1kW heaters controlled by a PID controller. A stirrer with a large paddle ensures that the heat is evenly distributed. The evaporating pressure is controlled by an automatic expansion valve.

The refrigerant vapour returns to the compressor through a suction line heat exchanger.

Twelve temperature readings, five pressure readings, compressor power and heat input are all recorded automatically using DasyLab.

The tests were run at a condensing temperature of 40°C and an evaporator superheat of 8°C ( $\pm 0.5^\circ\text{C}$ ).

For R22 the temperature at the end of the evaporator was maintained at 8°C above the temperature equivalent to the evaporating pressure.

For the other refrigerants the temperature at the end of the evaporator was maintained at 8°C above the temperature equivalent to the evaporating pressure (Dew point)

The mean evaporator temperature (ev. temp) for these refrigerants was calculated by taking the temperature equivalent to the evaporator pressure from the bubble point table and adding to that half the glide at that temperature.

Initially, the pressure was roughly set and then the temperature of the bath was set. The pressure would then be readjusted to ensure that there was 8°C superheat present. The superheat was measured from the third evaporator outlet. No

adjustments were made during the run, except for possibly minor changes to the valve at the exit of the compressor, in order to keep the conditions as constant as possible. The test was then continued for at least one hour during which time 6 readings were taken i.e. every 10 minutes. If these readings were stable, then their average was calculated.

#### **Specific experimental details for each refrigerant**

The refrigerant list is given in the order in which the measurements were carried out.

**R22:** R22 (3.477kg) was charged into the liquid receiver. Since this was the first time that the LT calorimeter had been used since a major modification base data for R22 was required. Accordingly, eight data points were obtained between the evaporating temperatures of  $-33^{\circ}\text{C}$  to  $-21^{\circ}\text{C}$ .

**75% R125:** Approximately 3.54kg were charged into the liquid receiver. Four data points were obtained between the mean evaporating temperatures of  $-31^{\circ}\text{C}$  to  $-23^{\circ}\text{C}$  respectively. At a mean evaporating temperature of  $-23^{\circ}\text{C}$  the expansion valve was fully opened.

**85% R125:** Approximately 3.55kg were charged into the liquid receiver. Four data points were obtained between the mean evaporating temperatures of  $-31^{\circ}\text{C}$  and  $-25^{\circ}\text{C}$ . At a mean evaporating temperature of  $-26^{\circ}\text{C}$  the expansion valve was fully opened.

**R407C:** Approximately 3.59kg were charged into the liquid receiver. Five data points were obtained between mean evaporating temperatures of  $-32^{\circ}\text{C}$  to  $-20^{\circ}\text{C}$ .

**70% R125:** Approximately 3.5kg were charged into the liquid receiver. Five data points were obtained between the mean evaporating temperatures of  $-32^{\circ}\text{C}$  to  $-21^{\circ}\text{C}$ .

**R404A:** Approximately 3.51kg were

charged into the liquid receiver. Five data points were obtained between the mean evaporating temperatures of  $-33^{\circ}\text{C}$  to  $-25^{\circ}\text{C}$ .

## Results

The results obtained are summarised in Tables 3-8. Mean Ev. Temp = Mean evaporation temperature; Air On Condenser = temperature of the air in the room that is blown over the air cooled condenser, measured just prior to the air blowing over the condenser; Press = pressure.

## Comments and discussion on the experimental results

Graph 1 shows a comparison of capacities at a mean evaporating temperature of  $-30^{\circ}\text{C}$ , compared to R404A. This evaporating temperature is considered to be fairly typical of where a low temperature refrigerant would be expected to operate. It can be seen that 85% R125 has a slightly better relative capacity than R404A, whereas the other refrigerants tested are poorer. R22 and 75% R125 are the next best. At this temperature R407C is the poorest, but it improves relatively as the mean evaporating temperature increases. Generally, there is an improvement in cooling capacity as the R125 content increases.

Graph 2 shows the COP results obtained. It shows that 85% R125 gives the best efficiency at  $-30^{\circ}\text{C}$  and is the only refrigerant better than R404A.

Graphs 3 and 4 show the capacity and COP for any given refrigerant relative to R22. These again show the similarity of 85% R125 to R404A, which are both 5-10% up on R22.

The preferred formulation is therefore 85% R125. Assuming that n-butane has the same GWP as methane (21). This is 22% less than that of R404a and 23% less than that of R507.

The preferred composition is 85%w/w R125, 11.5%w/w R134a and 3.5%w/w butane. This has a vapour pressure-temperature relationship very close to that of R404A. For example, at  $-30^{\circ}\text{C}$  the R404A liquid has a vapour pressure of 0.209MPa

(30.3psia) and the preferred composition has a vapour pressure above the liquid of 0.218MPa (31.6psi) i.e. only 4% higher.

**Table 1 Details of test refrigerants**

Description	Composition
70% R125	R125/134a/600 (70.0/26.5/3.5)
75% R125	R125/134a/600 (75.0/21.5/3.5)
85% R125	R125/134a/600 (85.0/11.5/3.5)
R407C	R32/R125/R134a (23.0/25.0/52.0)
R404A	R125/R143a/R134a (44.1/51.9/4.0)
R22	Standard product

Table 2 Results of the experimental SVP measurements and the glide from REFPROP6

Description	SVP equation (see note 1)	Glide equation (see note 2)
70% R125	$y = -2357.53678x + 13.02249$	$y = -0.02391x + 3.22225$ $R^2 = 0.99786$
75% R125	$y = -2318.71536x + 12.93301$ $R^2 = 1.00000$	$y = -0.02122x + 2.84478$ $R^2 = 0.99704$
85% R125	$y = -2318.35322x + 12.98687$ $R^2 = 0.99998$	$y = -0.01305x + 1.85013$ $R^2 = 0.99456$
R407C (3)	$y = -2422.08237x + 13.27060$	$y = -0.000118x^2 - 0.027343x + 6.128020$ $R^2 = 0.998575$
R404A	$y = -2367.62611x + 13.14935$ $R^2 = 0.99994$	$y = -0.005014x + 0.547125$ $R^2 = 0.995941$
R22	(see note 4)	Not applicable

Notes:

- (1) In this equation  $x = 1/T$  where T is the bubble point in Kelvin:  $y = \ln(p)$ ,  
where p is the saturated vapour pressure in psia
- (2) In this equation  $x = t$ , where t is liquid temperature (bubble point) in degree C and  $y = \text{glide}$  in deg C at the bubble point temperature.
- (3) The data used was from Refprop, but was in agreement with that from the  
Ashrae handbook and from ICI.
- (4) The vapour pressures for R22 were obtained from the Ashrae handbook by interpolation.

CLAIMS

1. A refrigerant composition which comprises:

(a) pentafluoroethane, trifluoromethoxydifluoromethane or hexafluoro-  
5 cyclopropane, or a mixture of two or more thereof, in an amount of at least 75%  
based on the weight of the composition,

(b) 1,1,1,2- or 1,1,2,2-tetrafluoroethane,  
trifluoromethoxypentafluoroethane, 1,1,1,2,3,3-heptafluoropropane or a mixture of  
two or more thereof, in an amount of from 5 to 24% by weight based on the weight  
10 of the composition and

(c) an ethylenically unsaturated or saturated hydrocarbon, optionally  
containing one or more oxygen atoms, with a boiling point from -50°C to +35°C, or  
a mixture thereof in an amount from 1% to 4% by weight based on the weight of the  
composition, the weight ratio of component (a): component (b) being at least 3:1.

15 2. A composition according to claim 1 in which component (c) is present  
in an amount from 3 to 4% by weight based on the weight of the composition.

3. A composition according to claim 2 in which component (c) is present  
in an amount of about 3.5% by weight based on the weight of the composition.

4. A composition according to any one of claims 1 to 3 in which  
20 component (c) is propane, n-butane, isobutane, cyclobutane, cyclopropane,  
methylcyclopropane, pentane, isobutane, dimethylether, ethylmethyl ether, propene  
or oxetan.

5. A composition according to claim 4 in which component (c) is n-  
butane.

25 6. A composition according to any one of the preceding claims (a) is  
pentafluoroethane.

7. A composition according to any one of the preceding claims in which  
component (a) is present in an amount from 80 to 90% by weight based on the weight  
of the composition.

30 8. A composition according to claim 7 in which component (a) is present  
in an amount from 83 to 88% by weight based on the weight of the composition.

9. A composition according to any one of the preceding claims in which component (b) is 1,1,1,2-tetrafluoroethane.

10. A composition according to any one of the preceding claims in which component (b) is present in an amount from 10 to 15% by weight based on the weight of the composition.

11. A composition according to any one of the preceding claims in which the weight ratio of component (a): component (b) is 5:1 to 10:1.

12. A composition according to claim 11 in which the said weight ratio is 7:1 to 9:1.

13. A composition according to any one of the preceding claims which comprises a further component.

14. A composition according to claim 13 in which the further component is a hydrofluorocarbon.

15. A composition according to claim 14 in which the hydrofluorocarbon has a boiling point at atmospheric pressure of at most  $-40^{\circ}\text{C}$ .

16. A composition according to claim 14 or 15 in which the F/H ratio in the hydrofluorocarbon is at least 1.

17. A composition according to claim 16 in which the hydrofluorocarbon is difluoromethane or trifluoromethane.

18. A composition according to any one of claims 13 to 17 in which the further component is present in an amount not exceeding 5% by weight based on the weight of (a), (b) and (c).

19. A composition according to claim 18 in which the further component is present in an amount not exceeding 2% by weight based on the weight of (a), (b) and (c).

20. A composition according to claim 1 substantially as hereinbefore defined.

21. Use of a composition as claimed in any one of the preceding claims as a refrigerant in a refrigeration apparatus.

22. The process for producing refrigeration which comprises condensing a composition as claimed in any one of claims 1 to 20 and thereafter evaporating the

composition in the vicinity of a body to be cooled.

23. A refrigeration apparatus containing, as refrigerant, a composition as claimed in any one of claims 1 to 20.

### ABSTRACT

Refrigerant composition are disclosed which comprises:

(a) pentafluorethane, trifluoromethoxydifluoromethane or hexafluorocyclopropane, or a mixture of two or more thereof, in an amount of at least 75%  
5 based on the weight of the composition,

(b) 1,1,1,2- or 1,1,2,2-tetrafluoroethane, trifluoromethoxypentafluoroethane, 1,1,1,2,3,3-heptafluoropropane or a mixture of two or more thereof, in an amount of from 10 to 20% by weight based on the weight  
10 of the composition and

(c) an ethylenically unsaturated or saturated hydrocarbon, optionally containing one or more oxygen atoms, with a boiling point from  $-50^{\circ}\text{C}$  to  $+35^{\circ}\text{C}$ , or a mixture thereof in an amount from 1% to 4% by weight based on the weight of the composition the weight ratio of component (a): component (b) being at least 4:1.
